

Son of Mask

One of our more challenging projects complete with many limiting factors Wysiwyg 3D was called upon to help create and cyber scan the Son of Mask car for manufacturing and laser scan a mask for the dog animation.

Starting from approved sketches an artist's model was 3d laser scanned. A Holden Monaro or Pontiac GTO was also scanned as the basis of the Son of Mask car. Not only did it have to be finished in 11 weeks with a tight budget but it had to drive like a real car, including working head lights and doors, capable of driving at over 100mph as the mask stunt car but also be left hand drive. Whilst all filming was done in the streets of Melbourne Australia the movie was still American.
